

**A METHOD FOR CONTROLLING A COMPUTER USING AN EMBEDDED
UNIQUE CODE IN THE CONTENT OF DVD MEDIA**

ABSTRACT OF THE DISCLOSURE

5 A method for allowing a user PC (1702) to be controlled in order to effect a
connection between the user PC (1702) and a destination node (1706) on a network
(306). This is facilitated through an audio source (1700) wherein the content of digital
video disk recording media has embedded therein an audio signal. When the recording
media is played, the audio signal is extracted by an audio extractor (1600) and transmitted
10 to the user PC, and detected by a program running in the background of the user PC
(1702). Once the audible tone is detected, a web browser is launched and the tone or
decoded product identifier information associated with the tone is transmitted to an ARS
(308) on the network (306). The ARS (308) then compares the information received
from the user PC (1702) using information from a relational database (1704). The
15 relational database (1704) contains routing information for various destination nodes
(1706) on the network. When a match occurs, the matching information is then forwarded
back to the user PC (1702) and this is utilized to route the user PC (1702) to the
particular destination node (1706) corresponding to the audible tone for the processing of
information received therefrom.
